

# Machine-Level Programming I: Basics

Introduction to Computer Systems

4<sup>th</sup> Lecture, Sep. 20, 2023

**Instructors:**

**Class 1: Chen Xiangqun, Liu Xianhua**

**Class 2: Guan Xuetao**

**Class 3: Lu Junlin**

# Today: Machine Programming I: Basics

- History of Intel processors and architectures
- C, assembly, machine code
- Assembly Basics: Registers, operands, move
- Arithmetic & logical operations

# Intel x86 Processors

- **Dominate laptop/desktop/server market**
- **Evolutionary design**
  - Backwards compatible up until 8086, introduced in 1978
  - Added more features as time goes on
    - Now 3 volumes, about 5,000 pages of documentation
- **Complex instruction set computer (CISC)**
  - Many different instructions with many different formats
    - But, only small subset encountered with Linux programs
  - Hard to match performance of Reduced Instruction Set Computers (RISC)
  - But, Intel has done just that!
    - In terms of speed. Less so for low power.

# 2018 State of the Art: Coffee Lake

## ■ Mobile Model: Core i7

- 2.2-3.2 GHz
- 45 W

## ■ Desktop Model: Core i7

- Integrated graphics
- 2.4-4.0 GHz
- 35-95 W

## ■ Server Model: Xeon E

- Integrated graphics
- Multi-socket enabled
- 3.3-3.8 GHz
- 80-95 W

# x86 Clones: Advanced Micro Devices (AMD)

## ■ Historically

- AMD has followed just behind Intel
- A little bit slower, a lot cheaper

## ■ Then

- Recruited top circuit designers from Digital Equipment Corp. and other downward trending companies
- Built Opteron: tough competitor to Pentium 4
- Developed x86-64, their own extension to 64 bits

## ■ Recent Years

- Intel got its act together
  - 1995-2011: Lead semiconductor “fab” in world
  - 2018: #2 largest by \$\$ (#1 is Samsung)
  - 2019: reclaimed #1
- AMD fell behind
  - Relies on external semiconductor manufacturer GlobalFoundries
  - ca. 2019 CPUs (e.g., Ryzen) are competitive again

# Intel's 64-Bit History

- **2001: Intel Attempts Radical Shift from IA32 to IA64**
  - Totally different architecture (Itanium)
  - Executes IA32 code only as legacy
  - Performance disappointing
- **2003: AMD Steps in with Evolutionary Solution**
  - x86-64 (now called “AMD64”)
- **Intel Felt Obligated to Focus on IA64**
  - Hard to admit mistake or that AMD is better
- **2004: Intel Announces EM64T extension to IA32**
  - Extended Memory 64-bit Technology
  - Almost identical to x86-64!
- **All but low-end x86 processors support x86-64**
  - But, lots of code still runs in 32-bit mode

# Our Coverage

## ■ IA32

- The traditional x86
- For this course: RIP, Fall 2016

## ■ x86-64

- The standard
- `Server> gcc hello.c`
- `Server> gcc -m64 hello.c`

## ■ Presentation

- Book covers x86-64
- Web aside on IA32
- We will only cover x86-64

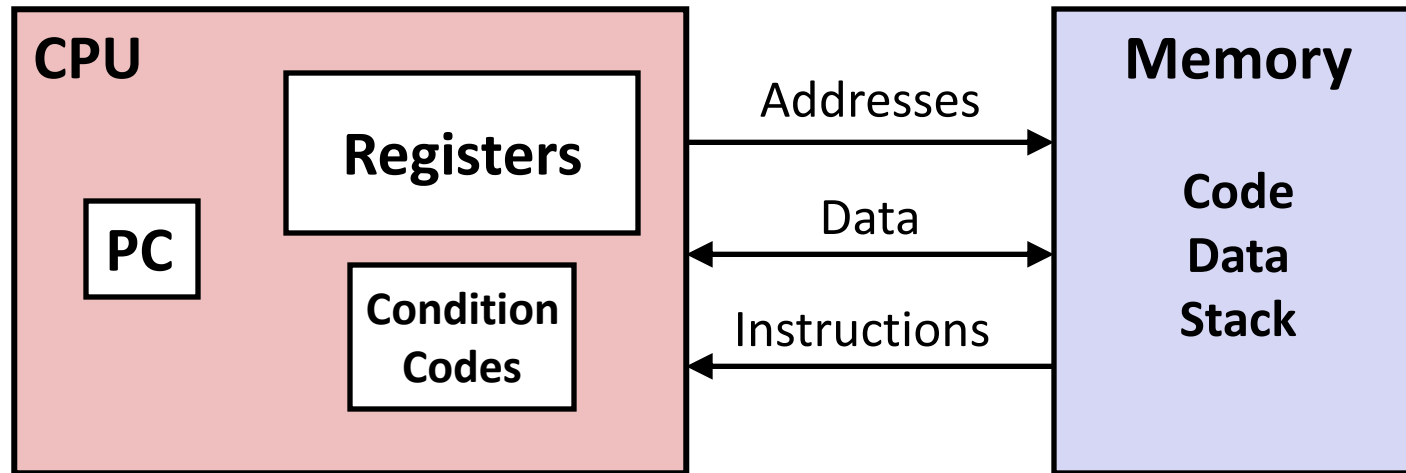

# Today: Machine Programming I: Basics

- History of Intel processors and architectures
- **C, assembly, machine code**
- Assembly Basics: Registers, operands, move
- Arithmetic & logical operations

# Definitions

- **Architecture:** (also ISA: instruction set architecture) The parts of a processor design that one needs to understand for writing correct machine/assembly code
  - Examples: instruction set specification, registers
  - **Machine Code:** The byte-level programs that a processor executes
  - **Assembly Code:** A text representation of machine code
- **Microarchitecture:** Implementation of the architecture
  - Examples: cache sizes and core frequency
- **Example ISAs:**
  - Intel: x86, IA32, Itanium, x86-64
  - ARM: Used in almost all mobile phones
  - RISC V: New open-source ISA

# Assembly/Machine Code View

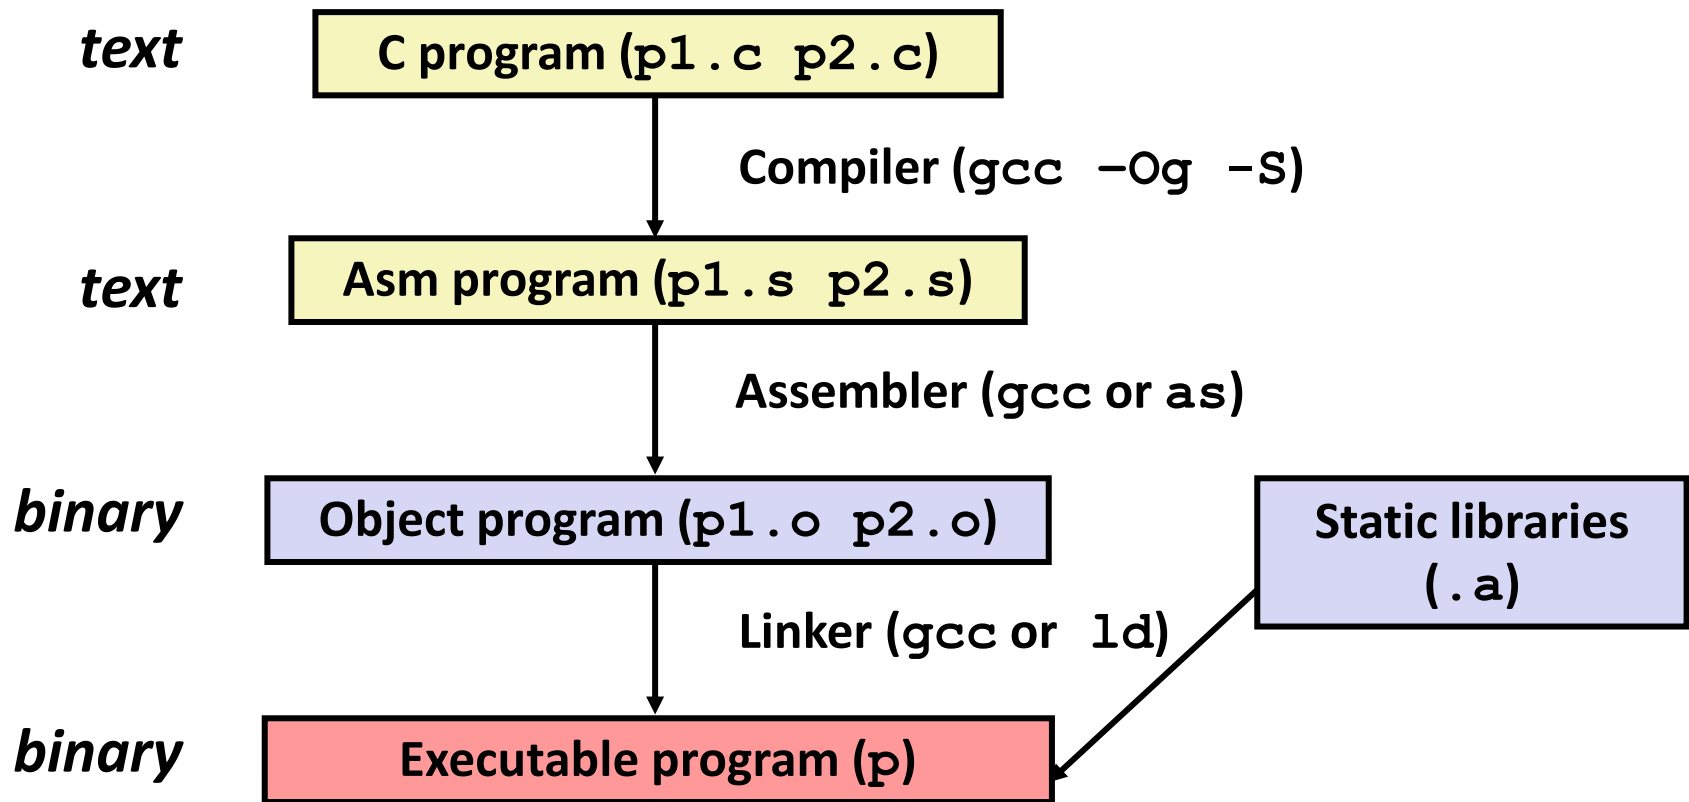

## Programmer-Visible State

- **PC: Program counter**
  - Address of next instruction
  - Called “RIP” (x86-64)
- **Register file**
  - Heavily used program data
- **Condition codes**
  - Store status information about most recent arithmetic or logical operation
  - Used for conditional branching
- **Memory**
  - Byte addressable array
  - Code and user data
  - Stack to support procedures

# Turning C into Object Code

- Code in files `p1.c` `p2.c`
- Compile with command: `gcc -Og p1.c p2.c -o p`
  - Use basic optimizations (`-Og`) [New to recent versions of GCC]
  - Put resulting binary in file `p`

# Compiling Into Assembly

## C Code (sum.c)

```
long plus(long x, long y);

void sumstore(long x, long y,
              long *dest)
{
    long t = plus(x, y);
    *dest = t;
}
```

## Generated x86-64 Assembly

```
sumstore:
    pushq    %rbx
    movq     %rdx, %rbx
    call     plus
    movq     %rax, (%rbx)
    popq     %rbx
    ret
```

Obtain (on our server machine) with command

```
gcc -Og -S sum.c
```

Produces file `sum.s`

**Warning:** Will get very different results on our server machines (Andrew Linux, Mac OS-X, ...) due to different versions of gcc and different compiler settings.

# Assembly Characteristics: Data Types

- **“Integer” data of 1, 2, 4, or 8 bytes**
  - Data values
  - Addresses (untyped pointers)
- **Floating point data of 4, 8, or 10 bytes**
- **(SIMD vector data types of 8, 16, 32 or 64 bytes)**
- **Code: Byte sequences encoding series of instructions**
- **No aggregate types such as arrays or structures**
  - Just contiguously allocated bytes in memory

# Assembly Characteristics: Operations

- **Transfer data between memory and register**
  - Load data from memory into register
  - Store register data into memory
  
- **Perform arithmetic function on register or memory data**
  
- **Transfer control**
  - Unconditional jumps to/from procedures
  - Conditional branches
  - Indirect branches

# Object Code

## Code for `sumstore`

0x0400595:

0x53

0x48

0x89

0xd3

0xe8

0xf2

0xff

0xff

0xff

0x48

0x89

0x03

0x5b

0xc3

- Total of 14 bytes
- Each instruction 1, 3, or 5 bytes
- Starts at address 0x0400595

## ■ Assembler

- Translates `.s` into `.o`
- Binary encoding of each instruction
- Nearly-complete image of executable code
- Missing linkages between code in different files

## ■ Linker

- Resolves references between files
- Combines with static run-time libraries
  - E.g., code for `malloc`, `printf`
- Some libraries are *dynamically linked*
  - Linking occurs when program begins execution

# Machine Instruction Example

```
*dest = t;
```

```
movq %rax, (%rbx)
```

```
0x40059e:  48 89 03
```

## ■ C Code

- Store value `t` where designated by `dest`

## ■ Assembly

- Move 8-byte value to memory
  - Quad words in x86-64 parlance
- Operands:
  - `t`: Register `%rax`
  - `dest`: Register `%rbx`
  - `*dest`: Memory `M[%rbx]`

## ■ Object Code

- 3-byte instruction
- Stored at address `0x40059e`

# Disassembling Object Code

## Disassembled

```

0000000000400595 <sumstore>:
  400595:  53                      push    %rbx
  400596:  48 89 d3                mov     %rdx,%rbx
  400599:  e8 f2 ff ff ff         callq   400590 <plus>
  40059e:  48 89 03                mov     %rax, (%rbx)
  4005a1:  5b                      pop     %rbx
  4005a2:  c3                      retq

```

## ■ Disassembler

`objdump -d sum`

- Useful tool for examining object code
- Analyzes bit pattern of series of instructions
- Produces approximate rendition of assembly code
- Can be run on either a `.out` (complete executable) or `.o` file

# Some History: IA32 Registers

# Moving Data

## ■ Moving Data

`movq Source, Dest:`

## ■ Operand Types

- **Immediate:** Constant integer data
  - Example: `$0x400`, `$-533`
  - Like C constant, but prefixed with ``$'`
  - Encoded with 1, 2, or 4 bytes
- **Register:** One of 16 integer registers
  - Example: `%rax`, `%r13`
  - But `%rsp` reserved for special use
  - Others have special uses for particular instructions
- **Memory:** 8 consecutive bytes of memory at address given by register
  - Simplest example: `(%rax)`
  - Various other “address modes”

`%rax`

`%rcx`

`%rdx`

`%rbx`

`%rsi`

`%rdi`

`%rsp`

`%rbp`

`%rN`

**Warning: Intel docs use**  
**`mov Dest, Source`**

# Complete Memory Addressing Modes

## ■ Most General Form

**$D(Rb, Ri, S)$                        $Mem[Reg[Rb] + S * Reg[Ri] + D]$**

- D:     Constant “displacement” 1, 2, or 4 bytes
- Rb:    Base register: Any of 16 integer registers
- Ri:     Index register: Any, except for `%rsp`
- S:     Scale: 1, 2, 4, or 8 (*why these numbers?*)

## ■ Special Cases

**$(Rb, Ri)$                        $Mem[Reg[Rb] + Reg[Ri]]$**

**$D(Rb, Ri)$                        $Mem[Reg[Rb] + Reg[Ri] + D]$**

**$(Rb, Ri, S)$                        $Mem[Reg[Rb] + S * Reg[Ri]]$**

# Address Computation Instruction

## ■ `leaq Src, Dst`

- *Src* is address mode expression
- Set *Dst* to address denoted by expression

## ■ Uses

- Computing addresses without a memory reference
  - E.g., translation of `p = &x[i];`
- Computing arithmetic expressions of the form  $x + k*y$ 
  - $k = 1, 2, 4, \text{ or } 8$

## ■ Example

```
long m12(long x)
{
    return x*12;
}
```

Converted to ASM by compiler:

```
leaq (%rdi,%rdi,2), %rax # t <- x+x*2
salq $2, %rax           # return t<<2
```

# Some Arithmetic Operations

## ■ Two Operand Instructions:

<i>Format</i>	<i>Computation</i>	
<code>addq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} + \text{Src}$
<code>subq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} - \text{Src}$
<code>imulq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} * \text{Src}$
<code>salq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} \ll \text{Src}$
<code>sarq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} \gg \text{Src}$
<code>shrq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} \gg \text{Src}$
<code>xorq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} \wedge \text{Src}$
<code>andq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest} \& \text{Src}$
<code>orq</code>	<i>Src, Dest</i>	$\text{Dest} = \text{Dest}   \text{Src}$

*Also called `shlq`*

*Arithmetic*

*Logical*

## ■ Watch out for argument order!

- (Warning: Intel docs use “op *Dest, Src*”)

## ■ No distinction between signed and unsigned int (why?)

# Some Arithmetic Operations

## ■ One Operand Instructions

`incq`      *Dest*       $Dest = Dest + 1$

`decq`      *Dest*       $Dest = Dest - 1$

`negq`      *Dest*       $Dest = -Dest$

`notq`      *Dest*       $Dest = \sim Dest$

## ■ See book for more instructions

# Arithmetic Expression Example

```
long arith
(long x, long y, long z)
{
    long t1 = x+y;
    long t2 = z+t1;
    long t3 = x+4;
    long t4 = y * 48;
    long t5 = t3 + t4;
    long rval = t2 * t5;
    return rval;
}
```

arith:

```
leaq    (%rdi,%rsi), %rax
addq    %rdx, %rax
leaq    (%rsi,%rsi,2), %rdx
salq    $4, %rdx
leaq    4(%rdi,%rdx), %rcx
imulq   %rcx, %rax
ret
```

## Interesting Instructions

- **leaq**: address computation
- **salq**: shift
- **imulq**: multiplication
  - But, only used once

# Understanding Arithmetic Expression

## Example

```
long arith
(long x, long y, long z)
{
    long t1 = x+y;
    long t2 = z+t1;
    long t3 = x+4;
    long t4 = y * 48;
    long t5 = t3 + t4;
    long rval = t2 * t5;
    return rval;
}
```

```
arith:
    leaq    (%rdi,%rsi), %rax    # t1
    addq    %rdx, %rax          # t2
    leaq    (%rsi,%rsi,2), %rdx
    salq    $4, %rdx            # t4
    leaq    4(%rdi,%rdx), %rcx   # t5
    imulq   %rcx, %rax          # rval
    ret
```

Register	Use(s)
%rdi	Argument <b>x</b>
%rsi	Argument <b>y</b>
%rdx	Argument <b>z</b> , <b>t4</b>
%rax	<b>t1</b> , <b>t2</b> , <b>rval</b>
%rdx	<b>t4</b>
%rcx	<b>t5</b>

# Machine Programming I: Summary

## ■ History of Intel processors and architectures

- Evolutionary design leads to many quirks and artifacts

## ■ C, assembly, machine code

- New forms of visible state: program counter, registers, ...
- Compiler must transform statements, expressions, procedures into low-level instruction sequences

## ■ Assembly Basics: Registers, operands, move

- The x86-64 move instructions cover wide range of data movement forms

## ■ Arithmetic

- C compiler will figure out different instruction combinations to carry out computation
