Machine-Level Programming IV: Data

Introduction to Computer Systems
7th Lecture, Oct. 9, 2023

Instructors:

Class 1: Chen Xiangqun, Liu Xianhua

Class 2: Guan Xuetao

Class 3: Lu Junlin

Today

- **Arrays**
  - One-dimensional
  - Multi-dimensional (nested)
  - Multi-level
- **Structures**
  - Allocation
 - Access
  - Alignment
- **Floating Point**

# Array Allocation

- **Basic Principle**

  T `A`[*L*]`;`

  - Array of data type *T* and length *L*
  - Contiguously allocated region of *L* * `sizeof`(*T*) bytes in memory

`char string[12];`
x $x + 12$

`int val[5];`

x $x + 4$ $x + 8$ $x + 12$ $x + 16$ $x + 20$

`double a[3];`

x $x + 8$ $x + 16$ $x + 24$

`char *p[3];`

x $x + 8$ $x + 16$ $x + 24$

Array Access

■ **Basic Principle**

T `A[`L`];`

- Array of data type T and length L
- Identifier `A` can be used as a pointer to array element 0: Type $T*$

`int val[5];`

| 1	5	2	1	3

`x`   `x + 4`   `x + 8`   `x + 12`   `x + 16`   `x + 20`

■ **Reference   Type   Value**

Reference	Type	Value
`val[4]`	`int`	
`val`	`int *`	
`val+1`	`int *`	
`&val[2]`	`int *`	
`val[5]`	`int`	
`*(val+1)`	`int`	
`val + `i	`int *`	

Array Access

■ Basic Principle

T `A[`*L*`];`

- Array of data type *T* and length *L*
- Identifier `A` can be used as a pointer to array element 0: Type *T**

```
int val[5];
```

1	5	2	1	3

x   x + 4   x + 8   x + 12   x + 16   x + 20

■ Reference   Type   Value

Reference	Type	Value
`val[4]`	`int`	3
`val`	`int *`	
`val+1`	`int *`	
`&val[2]`	`int *`	
`val[5]`	`int`	
`*(val+1)`	`int`	
`val + `*i*	`int *`	

Array Access

■ **Basic Principle**

T `A[`*L*`];`

- Array of data type *T* and length *L*
- Identifier `A` can be used as a pointer to array element 0: Type *T**

`int val[5];`

1	5	2	1	3

`x`   `x + 4`   `x + 8`   `x + 12`   `x + 16`   `x + 20`

■ **Reference**   **Type**   **Value**

| Reference	Type	Value	
`val[4]`	`int`	`3`	
`val`	`int *`	`x`	
`val+1`	`int *`	`x + 4`	
`&val[2]`	`int *`	`x + 8`	
`val[5]`	`int`	`??`	
`*(val+1)`	`int`	`5`	`//val[1]`
`val + i`	`int *`	`x + 4 * i`	`//&val[i]`

Array Example

```
#define ZLEN 5
typedef int zip_dig[ZLEN];

zip_dig cmu = { 1, 5, 2, 1, 3 };
zip_dig mit = { 0, 2, 1, 3, 9 };
zip_dig ucb = { 9, 4, 7, 2, 0 };
```

`zip_dig cmu;`	1	5	2	1	3
	16	20	24	28	32	36

`zip_dig mit;`	0	2	1	3	9
	36	40	44	48	52	56

`zip_dig ucb;`	9	4	7	2	0
	56	60	64	68	72	76

- **Declaration "`zip_dig cmu`" equivalent to "`int cmu[5]`"**
- **Example arrays were allocated in successive 20 byte blocks**
  - Not guaranteed to happen in general

7

Array Accessing Example

zip_dig cmu;

1	5	2	1	3

16   20   24   28   32   36
```
int get_digit
   (zip_dig z, int digit)
{
   return z[digit];
}
```

IA32

```
  # %rdi = z
  # %rsi = digit
movl (%rdi,%rsi,4), %eax  # z[digit]
```

- Register `%rdi` contains starting address of array
- Register `%rsi` contains array index
- Desired digit at `%rdi + 4*%rsi`
- Use memory reference `(%rdi,%rsi,4)`

Array Loop Example

```
void zincr(zip_dig z) {
  size_t i;
  for (i = 0; i < ZLEN; i++)
    z[i]++;
}
```

```
  # %rdi = z
  movl    $0, %eax            #   i = 0
  jmp     .L3                 #   goto middle
.L4:                          # loop:
  addl    $1, (%rdi,%rax,4)   #   z[i]++
  addq    $1, %rax            #   i++
.L3:                          # middle
  cmpq    $4, %rax            #   i:4
  jbe     .L4                 #   if <=, goto loop
  rep; ret
```
Multidimensional (Nested) Arrays

- **Declaration**

  T **A**[*R*][*C*];

  - 2D array of data type *T*
  - *R* rows, *C* columns
  - Type *T* element requires *K* bytes

- **Array Size**

  - *R * C * K* bytes

- **Arrangement**

  - Row-Major Ordering

$$\begin{bmatrix} \texttt{A[0][0]} & \bullet\bullet\bullet & \texttt{A[0][C-1]} \\ \bullet & & \bullet \\ \bullet & & \bullet \\ \bullet & & \bullet \\ \texttt{A[R-1][0]} & \bullet\bullet\bullet & \texttt{A[R-1][C-1]} \end{bmatrix}$$

```
int A[R][C];
```

| A [0] [0]	• • •	A [0] [C-1]	A [1] [0]	• • •	A [1] [C-1]	• • •	A [R-1] [0]	• • •	A [R-1] [C-1]

← **4*R*C** Bytes →
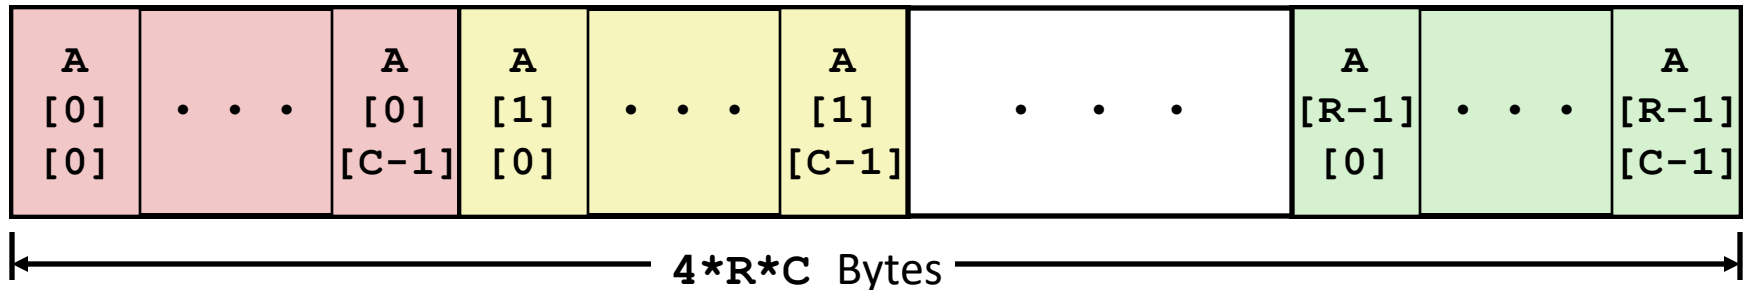

Nested Array Example

```
#define PCOUNT 4
zip_dig pgh[PCOUNT] =
  {{1, 5, 2, 0, 6},
   {1, 5, 2, 1, 3 },
   {1, 5, 2, 1, 7 },
   {1, 5, 2, 2, 1 }};
```

`zip_dig`
`pgh[4];`

| 1 | 5 | 2 | 0 | 6 | 1 | 5 | 2 | 1 | 3 | 1 | 5 | 2 | 1 | 7 | 1 | 5 | 2 | 2 | 1 |

76   96   116   136   156

- ■ **"`zip_dig pgh[4]`" equivalent to "`int pgh[4][5]`"**
  - ▪ Variable **`pgh`**: array of 4 elements, allocated contiguously
  - ▪ Each element is an array of 5 **`int`**'s, allocated contiguously
- ■ **"Row-Major" ordering of all elements in memory**

Nested Array Row Access

- **Row Vectors**
  - **A[i]** is array of *C* elements
  - Each element of type *T* requires *K* bytes
  - Starting address **A +** *i* * (*C* * *K*)

```
int A[R][C];
```

Nested Array Row Access Code

| 1 | 5 | 2 | 0 | 6 | 1 | 5 | 2 | 1 | 3 | 1 | 5 | 2 | 1 | 7 | 1 | 5 | 2 | 2 | 1 |

pgh   **pgh[2]**
```
int *get_pgh_zip(int index)
{
    return pgh[index];
}
```

```
  # %rdi = index
  leaq (%rdi,%rdi,4),%rax  # 5 * index
  leaq pgh(,%rax,4),%rax   # pgh + (20 * index)
```

- **Row Vector**
  - **pgh[index]** is array of 5 **int**'s
 - Starting address **pgh+20*index**

- **Machine Code**
  - Computes and returns address
 - Compute as **pgh + 4*(index+4*index)**

Nested Array Element Access

- **Array Elements**
  - **A[i][j]** is element of type *T,* which requires *K* bytes
  - Address **A +** *i * (C * K) + j * K = A + (i * C + j)* K*

```
int A[R][C];
```

A+(i*C*4)+(j*4)

Nested Array Element Access Code

| 1 | 5 | 2 | 0 | 6 | 1 | 5 | 2 | 1 | 3 | 1 | 5 | 2 | 1 | 7 | 1 | 5 | 2 | 2 | 1 |

pgh   **pgh[1][1]**

```
int get_pgh_digit(int index, int dig)
{
    return pgh[index][dig];
}
```

```
leaq    (%rdi,%rdi,4), %rax    # 5*index
addl    %rax, %rsi             # 5*index+dig
movl    pgh(,%rsi,4), %eax     # M[pgh + 4*(5*index+dig)]
```
- **Array Elements**
  - **pgh[index][dig]** is **int**
  - Address: **pgh + 20*index + 4*dig**
    = pgh + 4*(5*index + dig)

Multi-Level Array Example

```
zip_dig cmu = { 1, 5, 2, 1, 3 };
zip_dig mit = { 0, 2, 1, 3, 9 };
zip_dig ucb = { 9, 4, 7, 2, 0 };
```

```
#define UCOUNT 3
int *univ[UCOUNT] = {mit, cmu, ucb};
```
- **Variable `univ` denotes array of 3 elements**
- **Each element is a pointer**
  - 8 bytes
- **Each pointer points to array of `int`'s**

Element Access in Multi-Level Array

```
int get_univ_digit
   (size_t index, size_t digit)
{
   return univ[index][digit];
}
```

```
   salq    $2, %rsi              # 4*digit
   addq    univ(,%rdi,8), %rsi  # p = univ[index] + 4*digit
   movl    (%rsi), %eax          # return *p
   ret
```
- **Computation**
  - Element access `Mem[Mem[univ+8*index]+4*digit]`
  - Must do two memory reads
    - First get pointer to row array
    - Then access element within array
17

Array Element Accesses

Nested array

```
int get_pgh_digit
  (size_t index, size_t digit)
{
  return pgh[index][digit];
}
```

Multi-level array

```
int get_univ_digit
  (size_t index, size_t digit)
{
  return univ[index][digit];
}
```

Accesses looks similar in C, but address computations very different:

`Mem[pgh+20*index+4*digit]`   `Mem[Mem[univ+8*index]+4*digit]`

N X N Matrix Code

- **Fixed dimensions**
  - Know value of N at compile time

- **Variable dimensions, explicit indexing**
  - Traditional way to implement dynamic arrays

- **Variable dimensions, implicit indexing**
  - Now supported by gcc

```c
#define N 16
typedef int fix_matrix[N][N];
/* Get element a[i][j] */
int fix_ele(fix_matrix a,
            size_t i, size_t j)
{
  return a[i][j];
}
```

```c
#define IDX(n, i, j) ((i)*(n)+(j))
/* Get element a[i][j] */
int vec_ele(size_t n, int *a,
            size_t i, size_t j)
{
  return a[IDX(n,i,j)];
}
```

```c
/* Get element a[i][j] */
int var_ele(size_t n, int a[n][n],
            size_t i, size_t j) {
  return a[i][j];
}
```

16 X 16 Matrix Access

■ **Array Elements**

▪ Address **A** + $i * (C * K) + j * K$

▪ C = 16, K = 4

```
/* Get element a[i][j] */
int fix_ele(fix_matrix a, size_t i, size_t j) {
  return a[i][j];
}
```

```
  # a in %rdi, i in %rsi, j in %rdx
  salq    $6, %rsi            # 64*i
  addq    %rsi, %rdi          # a + 64*i
  movl    (%rdi,%rdx,4), %eax  # M[a + 64*i + 4*j]
  ret
```

n X n Matrix Access

- **Array Elements**
  - Address **A** + $i * (C * K) + j * K$
  - C = n, K = 4
  - Must perform integer multiplication

```
/* Get element a[i][j] */
int var_ele(size_t n, int a[n][n], size_t i, size_t j)
{
  return a[i][j];
}
```

```
    # n in %rdi, a in %rsi, i in %rdx, j in %rcx
    imulq   %rdx, %rdi              # n*i
    leaq    (%rsi,%rdi,4), %rax  # a + 4*n*i
    movl    (%rax,%rcx,4), %eax  # a + 4*n*i + 4*j
    ret
```

Example: Array Access

```c
#include <stdio.h>
#define ZLEN 5
#define PCOUNT 4
typedef int zip_dig[ZLEN];

int main(int argc, char** argv) {
zip_dig pgh[PCOUNT] =
    {{1, 5, 2, 0, 6},
     {1, 5, 2, 1, 3 },
     {1, 5, 2, 1, 7 },
     {1, 5, 2, 2, 1 }};
    int *linear_zip = (int *) pgh;
    int *zip2 = (int *) pgh[2];
    int result =
        pgh[0][0] +
        linear_zip[7] +
        *(linear_zip + 8) +
        zip2[1];
    printf("result: %d\n", result);
    return 0;
}
```

```
linux> ./array
```

Example: Array Access

```c
#include <stdio.h>
#define ZLEN 5
#define PCOUNT 4
typedef int zip_dig[ZLEN];

int main(int argc, char** argv) {
zip_dig pgh[PCOUNT] =
    {{1, 5, 2, 0, 6},
     {1, 5, 2, 1, 3 },
     {1, 5, 2, 1, 7 },
     {1, 5, 2, 2, 1 }};
    int *linear_zip = (int *) pgh;
    int *zip2 = (int *) pgh[2];
    int result =
        pgh[0][0] +
        linear_zip[7] +
        *(linear_zip + 8) +
        zip2[1];
    printf("result: %d\n", result);
    return 0;
}
```

```
linux> ./array
result: 9
```

Today

- **Arrays**
  - One-dimensional
  - Multi-dimensional (nested)
  - Multi-level

- **Structures**
 - Allocation
  - Access
  - Alignment

- **Floating Point**

Structure Representation

```
struct rec {
    int a[4];
    size_t i;
    struct rec *next;
};
```

r

a		i	next
0	16	24	32

- **Structure represented as block of memory**
  - **Big enough to hold all of the fields**

- **Fields ordered according to declaration**
  - **Even if another ordering could yield a more compact representation**

- **Compiler determines overall size + positions of fields**
  - **Machine-level program has no understanding of the structures in the source code**

Generating Pointer to Structure Member

```
struct rec {
    int a[4];
    size_t i;
    struct rec *next;
};
```

r   r+4*idx

a		i	next

0   16   24   32
- **Generating Pointer to Array Element**
  - Offset of each structure member determined at compile time
  - Compute as `r + 4*idx`

```
int *get_ap
 (struct rec *r, size_t idx)
{
  return &r->a[idx];
}
```
```
# r in %rdi, idx in %rsi
leaq  (%rdi,%rsi,4), %rax
ret
```

Following Linked List

```
struct rec {
    int a[4];
    int i;
    struct rec *next;
};
```

- **C Code**

```
void set_val
  (struct rec *r, int val)
{
  while (r) {
    int i = r->i;
    r->a[i] = val;
    r = r->next;
  }
}
```

r

a		i	next
0	16	24	32

Element i

| Register	Value
%rdi	r
%rsi	val

```
.L11:                           #  loop:
  movslq  16(%rdi), %rax        #    i = M[r+16]
  movl    %esi, (%rdi,%rax,4) #    M[r+4*i] = val
  movq    24(%rdi), %rdi        #    r = M[r+24]
  testq   %rdi, %rdi            #    Test r
  jne     .L11                  #    if !=0 goto loop
```
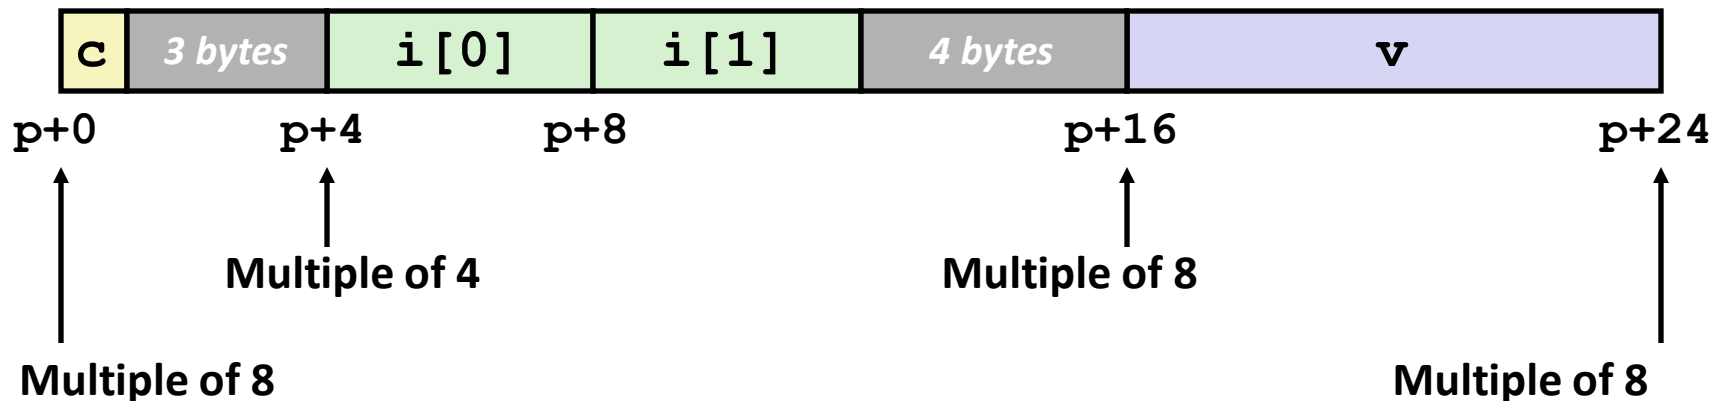

27

Structures & Alignment

- **Unaligned Data**

c	i[0]	i[1]	v

p p+1   p+5   p+9   p+17

```
struct S1 {
    char c;
    int i[2];
    double v;
} *p;
```

- **Aligned Data**

  - Primitive data type requires **K** bytes
  - Address must be multiple of **K**

c	*3 bytes*	i[0]	i[1]	*4 bytes*	v

p+0   p+4   p+8   p+16   p+24

Multiple of 4   Multiple of 8

Multiple of 8   Multiple of 8

Alignment Principles

- **Aligned Data**
  - Primitive data type requires *K* bytes
  - Address must be multiple of *K*
  - Required on some machines; advised on x86-64

- **Motivation for Aligning Data**
  - Memory accessed by (aligned) chunks of 4 or 8 bytes (system dependent)
    - Inefficient to load or store datum that spans quad word boundaries
    - Virtual memory trickier when datum spans 2 pages

- **Compiler**
  - Inserts gaps in structure to ensure correct alignment of fields

Specific Cases of Alignment (x86-64)

- **1 byte: `char`, …**
  - no restrictions on address

- **2 bytes: `short`, …**
  - lowest 1 bit of address must be 0_2

- **4 bytes: `int, float`, …**
  - lowest 2 bits of address must be 00_2

- **8 bytes: `double, long, char *`, …**
  - lowest 3 bits of address must be 000_2

- **16 bytes: `long double` (GCC on Linux)**
  - lowest 4 bits of address must be 0000_2

Satisfying Alignment with Structures

- **Within structure:**
  - Must satisfy each element's alignment requirement
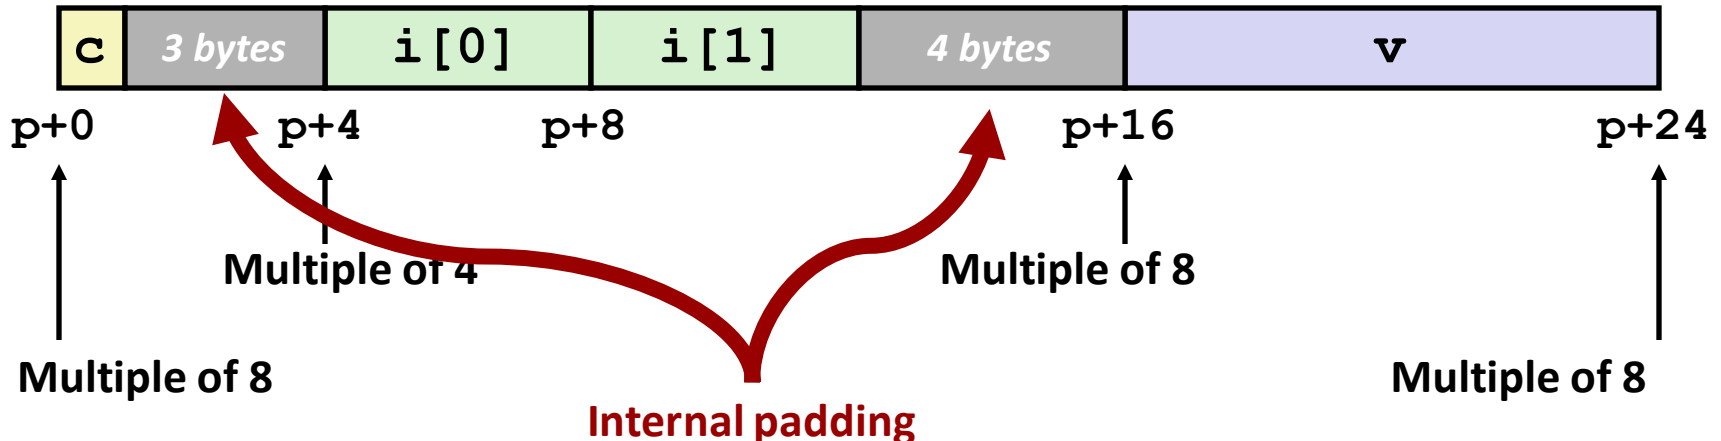

- **Overall structure placement**
  - Each structure has alignment requirement **K**
    - **K** = Largest alignment of any element
  - Initial address & structure length must be multiples of **K**

```
struct S1 {
  char c;
  int i[2];
  double v;
} *p;
```

- **Example:**
  - **K** = 8, due to **double** element
    NOTE: K < sizeof(struct S1)

c	3 bytes	i[0]	i[1]	4 bytes	v

p+0   p+4   p+8   p+16   p+24

Multiple of 4   Multiple of 8

Multiple of 8   Multiple of 8

Internal padding

Meeting Overall Alignment Requirement

- **For largest alignment requirement K**
- **Overall structure must be multiple of K**

```
struct S2 {
  double v;
  int i[2];
  char c;
} *p;
```
External padding

v	i[0]	i[1]	c	7 bytes

p+0   p+8   p+16   p+24

Multiple of K=8

Arrays of Structures

- **Overall structure length multiple of K**

- **Satisfy alignment requirement for every element**

```
struct S2 {
  double v;
  int i[2];
  char c;
} a[10];
```

a[0]	a[1]	a[2]

a+0   a+24   a+48   a+72

v	i[0]	i[1]	c	7 bytes

a+24   a+32   a+40   a+48

33

Accessing Array Elements

```
struct S3 {
    short i;
    float v;
    short j;
} a[10];
```

- **Compute array offset 12*idx**
  - **sizeof(S3)**, including alignment spacers

- **Element j is at offset 8 within structure**

- **Assembler gives offset a+8**
  - Resolved during linking

a[0]	• • •	a[idx]	• • •

a+0   a+12   a+12*idx

i	2 bytes	v	j	2 bytes

a+12*idx   a+12*idx+8
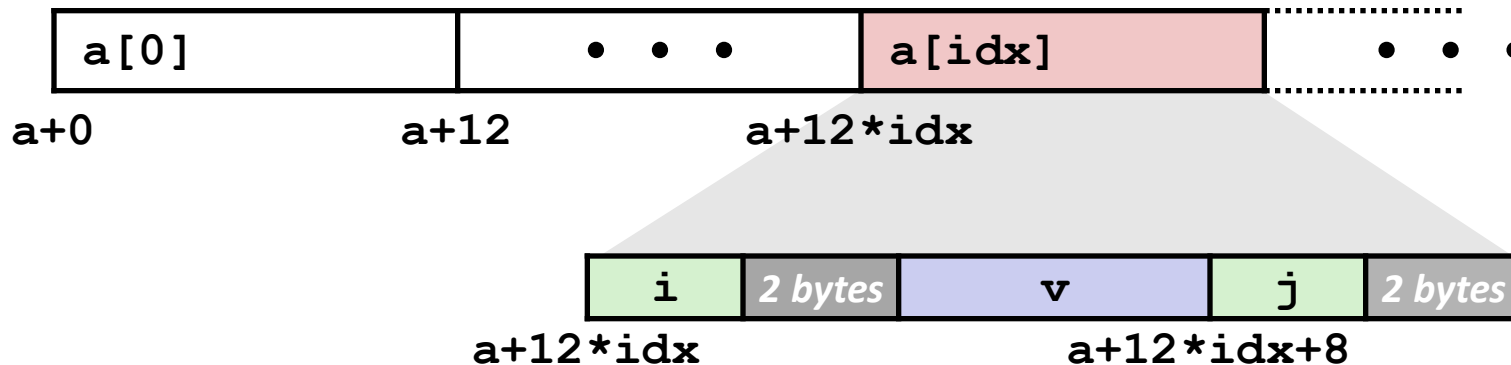

```
short get_j(int idx)
{
    return a[idx].j;
}
```

```
# %rdi = idx
leaq (%rdi,%rdi,2),%rax # 3*idx
movzwl a+8(,%rax,4),%eax
```
Saving Space

- **Put large data types first**

```
struct S4 {
  char c;
  int i;
  char d;
} *p;
```
```
struct S5 {
  int i;
  char c;
  char d;
} *p;
```

c	3 bytes	i	d	3 bytes	**12 bytes**

- **Effect (largest alignment requirement K=4)**

i	c	d	2 bytes	**8 bytes**

Today

- **Arrays**
  - One-dimensional
  - Multi-dimensional (nested)
  - Multi-level

- **Structures**
  - Allocation
  - Access
  - Alignment

- **Floating Point**

Background

- **History**
  - x87 FP
    - Legacy, very ugly
  - SSE FP
    - Supported by server machines
    - Special case use of vector instructions
  - AVX FP
    - Newest version
    - Similar to SSE
    - Documented in book

Programming with SSE3

XMM Registers

- 16 total, each 16 bytes

- 16 single-byte integers

- 8 16-bit integers

- 4 32-bit integers

- 4 single-precision floats
- 2 double-precision floats

- 1 single-precision float
- 1 double-precision float

Scalar & SIMD Operations
■ Scalar Operations: Single Precision

`addss %xmm0,%xmm1`

%xmm0

%xmm1

■ SIMD Operations: Single Precision

`addps %xmm0,%xmm1`

%xmm0

%xmm1

■ Scalar Operations: Double Precision

`addsd %xmm0,%xmm1`

%xmm0

%xmm1

FP Basics

- **Arguments passed in %xmm0, %xmm1, …**

- **Result returned in %xmm0**

- **All XMM registers caller-saved**

```
float fadd(float x, float y)
{
    return x + y;
}
```

```
double dadd(double x, double y)
{
    return x + y;
}
```

```
# x in %xmm0, y in %xmm1
addss   %xmm1, %xmm0
ret
```

```
# x in %xmm0, y in %xmm1
addsd   %xmm1, %xmm0
ret
```

FP Memory Referencing

- **Integer (and pointer) arguments passed in regular registers**
- **FP values passed in XMM registers**
- **Different mov instructions to move between XMM registers, and between memory and XMM registers**

```c
double dincr(double *p, double v)
{
    double x = *p;
    *p = x + v;
    return x;
}
```

```
  # p in %rdi, v in %xmm0
  movapd  %xmm0, %xmm1    # Copy v
  movsd   (%rdi), %xmm0   # x = *p
  addsd   %xmm0, %xmm1    # t = x + v
  movsd   %xmm1, (%rdi)   # *p = t
  ret
```

Other Aspects of FP Code

- ■ *Lots* of instructions
  - ▪ Different operations, different formats, …

- ■ **Floating-point comparisons**
  - ▪ Instructions **ucomiss** and **ucomisd**
  - ▪ Set condition codes ZF, PF and CF
  - ▪ Zeros OF and SF

  Parity Flag

  UNORDERED: ZF,PF,CF←111
  GREATER_THAN: ZF,PF,CF←000
  LESS_THAN: ZF,PF,CF←001
  EQUAL: ZF,PF,CF←100

- ■ **Using constant values**
  - ▪ Set XMM0 register to 0 with instruction **xorpd %xmm0, %xmm0**
  - ▪ Others loaded from memory

Summary

- **Arrays**
  - Elements packed into contiguous region of memory
  - Use index arithmetic to locate individual elements

- **Structures**
  - Elements packed into single region of memory
  - Access using offsets determined by compiler
  - Possible require internal and external padding to ensure alignment

- **Combinations**
  - Can nest structure and array code arbitrarily

- **Floating Point**
 - Data held and operated on in XMM registers
